

Don't rush this next step...

Clip the straps together, and then use a pen or another tool (awl) to determine the location to mount the long strap to the bottom of the trash can.

You will need to stretch the strap downward to get a tight fit.

Remember, the strap needs to be tight enough not to allow a bear to insert its claws between the lid and base of the trash can, but not too tight to restrict proper locking in cold weather.

Repeat the above procedure until all 4 straps are mounted onto the trash can.

Remember, mount the 2 side straps first, and then mount the 2 straps to the front of the trash can. Use the washers and locking-nut included with the straps.

Congratulations, you are part of the solution to reducing human and bear conflicts!
