

# GROUND ROD CLAMP + ROD

Ground Rod Clamp and Rod ensure a well grounded fence.

Grounding is one of the most important principals of electric fencing. It is extremely important to ensure there is good connection between your fence, Ground Rod Clamp, and the Ground Rod.

The best way to consistently get good grounding is by using a Ground Rod or Ground plate driven into the ground so just enough is showing to make using the ground rod clamp easy (3"-5").

1. Once the Ground rod or plate is installed take a ground rod clamp and place it over the end.
2. Take the end of your ground wire and fold a portion of it back on itself. (You can use pliers to bend the wire more cleanly.)
3. Place the doubled up wire on the "V" side of the ground clamp and tighten the ground clamp on the ground rod.
